Research Goals

- Create evaluation methods of MIDI-to-MIDI alignment of piano duet parts
- End goal is to create a robust performance-to-score alignment for quantifying ensemble coordination in distributed performance

Challenges of Duet Piano Music

Trills and extremely fast notes such as grace notes and cadenza like runs

Long sequences of repeated notes or chords

Periods of silence when players wait their turn to play

Distance Functions

Euclidean distance

$$ED(A,B) = \sqrt{\sum_{i=1}^{88}(x_{Ai} - x_{Bi})^2}$$

Meron & Hirose distance

$$MHD(A,B) = \frac{|A \cap B|}{|A \cup B|}$$

where A and B are feature vectors

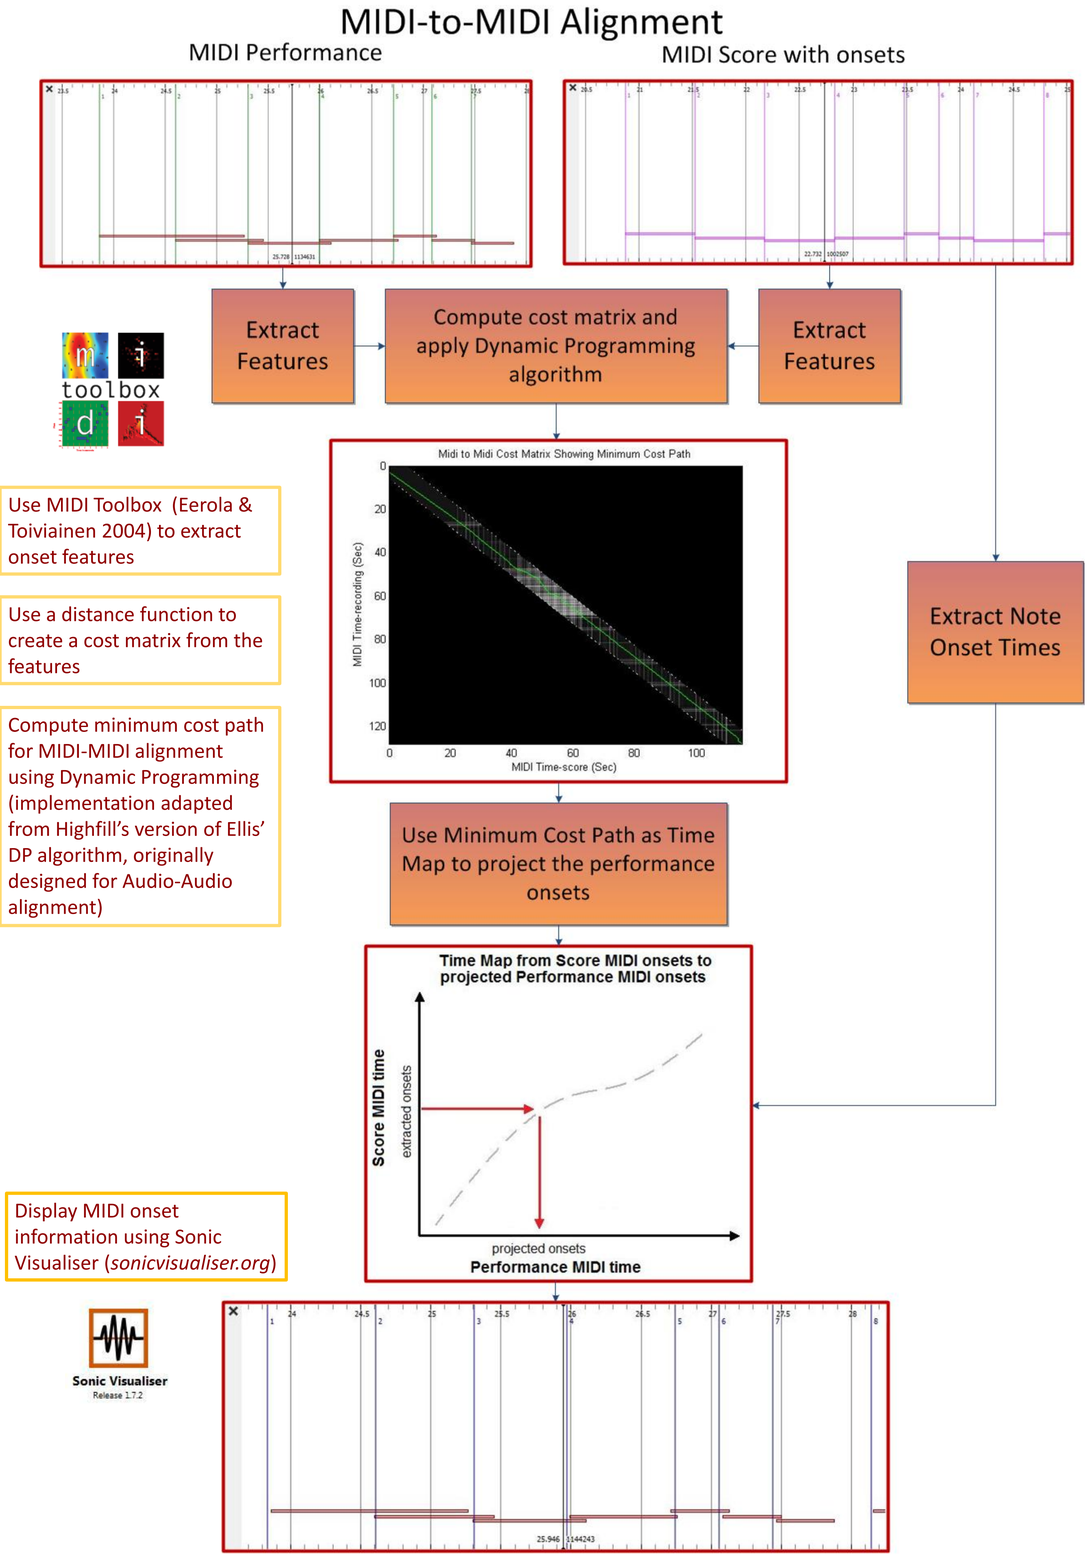
MIDI-to-MIDI Alignment



Use MIDI Toolbox (Eerola & Toiviainen 2004) to extract onset features

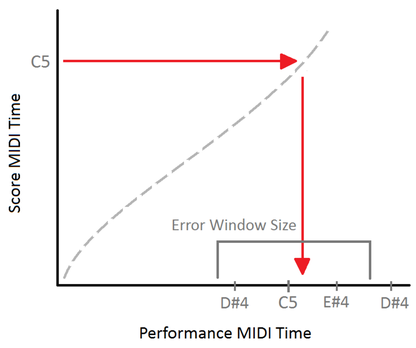
Use a distance function to create a cost matrix from the features

Compute minimum cost path for MIDI-MIDI alignment using Dynamic Programming (implementation adapted from Highfill's version of Ellis' DP algorithm, originally designed for Audio-Audio alignment)

Display MIDI onset information using Sonic Visualiser (*sonicvisualiser.org*)

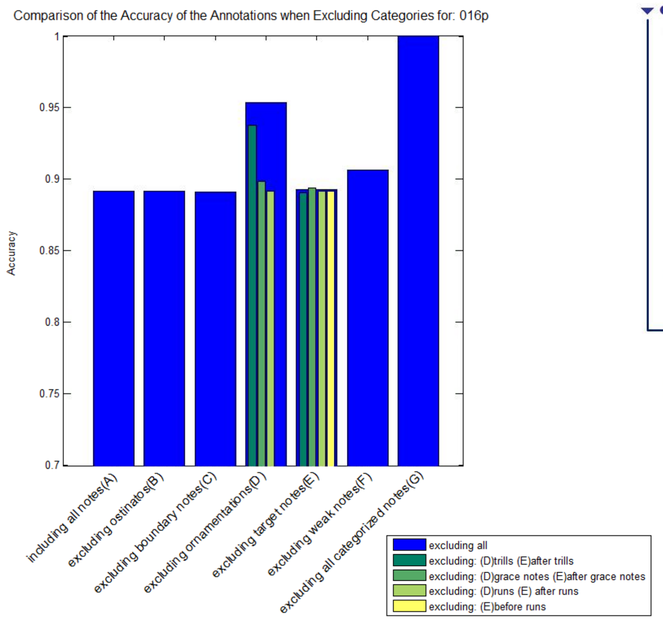
MIDI Performance with projected onsets

Evaluation & Preliminary Results

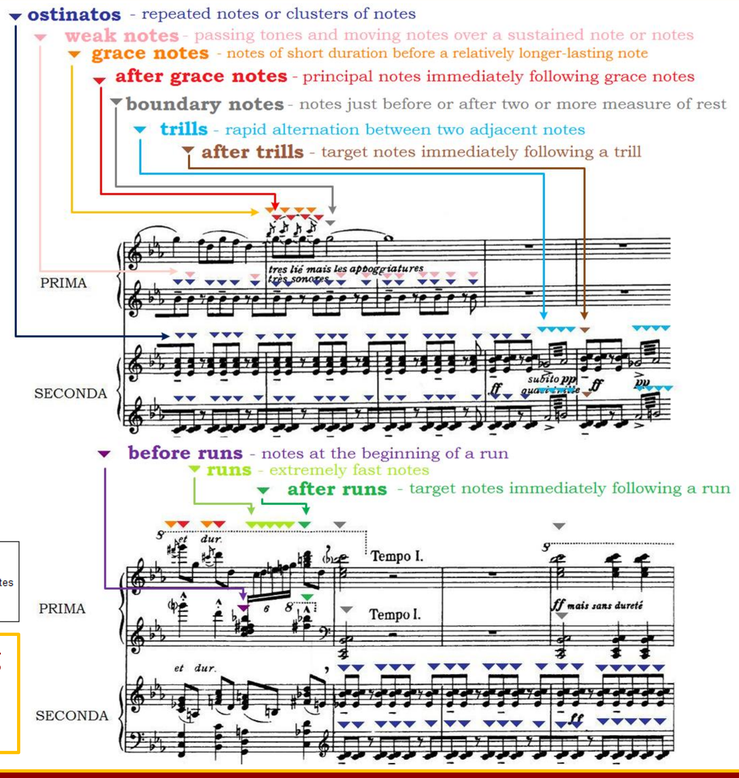


For each note in the score we use the onset time to find the matched time slice in the expressive performance file, and search within a window for that note. If the note is found, then the alignment is deemed correct, and when it is not, we note that an error has occurred.

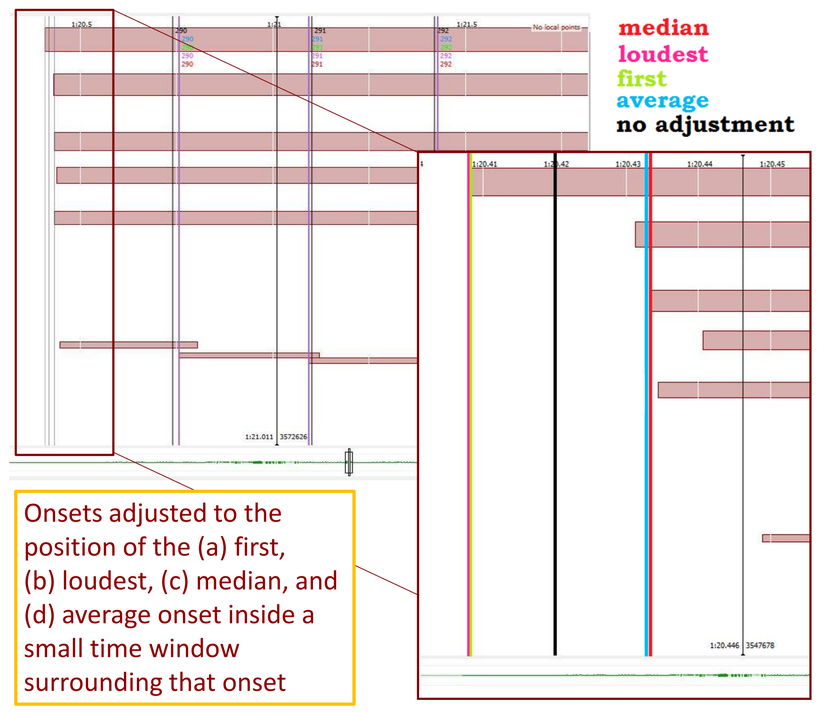
Note Categorization



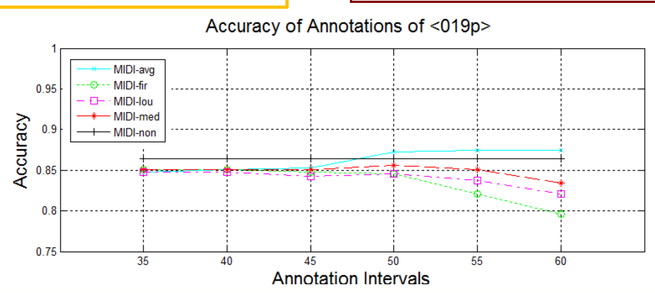
Preliminary results show that labeling and excluding problematic note categories help in accounting for alignment errors



Local Quantization



Onsets adjusted to the position of the (a) first, (b) loudest, (c) median, and (d) average onset inside a small time window surrounding that onset



While no quantization works well, quantization to the average onset works a little better for larger adjustment windows
